

For project2, what I did was learning how to implement the whole project and comprehend the structure the project. The reason that I'm getting this so slow was that was hard for me to combine and use html and python those two languages together, even though I'm really familiar Python this programming language. I watched some video tutorial then I just understand how Django works in the html files. However, I still provided some ideas when we were talking about the models, but I don't know why someone canceled most of them when the time approaching to the due date, and a lot of things had been changed without notifying before several days of due date.

I would say my contribution was 5% to 10%, because I didn't actually implement anything into our project, even though I provided my idea on models. At this point, I have to apologize to our teammates due to the insufficient ability of comprehending the structure of Django. I hope I will give more contribution on implementing the project 3 and final project.
